Human infection with avian influenza A(H5) viruses

Human infection with avian influenza A(H5N1) virus
Between 2 and 8 March 2018, no new cases of human infection with avian influenza A(H5N1) virus were reported to WHO in the Western Pacific Region.

As of 8 March 2018, a total of 238 cases of human infection with avian influenza A(H5N1) virus were reported from four countries within the Western Pacific Region since January 2003 (Table 1). Of these cases, 134 were fatal, resulting in a case fatality rate (CFR) of 56%. The last case was reported from China, with onset date of 27 December 2015 (1 case, no death).

Global, from January 2003 to 7 December 2017, there were 860 cases of human infection with avian influenza A(H5N1) virus reported from 16 countries worldwide. Of these 860 cases, 454 were fatal (CFR of 52.8%). The last case was reported from Indonesia on 26 September 2017. (Source: [http://www.who.int/influenza/human_animal_interface/HAI_Risk_Assessment/en/](http://www.who.int/influenza/human_animal_interface/HAI_Risk_Assessment/en/))

Human infection with avian influenza A(H5N6) virus
Between 2 and 8 March 2018, no new cases of human infection with avian influenza A(H5N6) virus were reported to WHO in the Western Pacific Region. To date, a total of 19 laboratory-confirmed cases of human infection with influenza A(H5N6) virus, including six deaths, have been reported to WHO from China since 2014.

Public health risk assessment for human infection with avian influenza A(H5) viruses
Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments; therefore sporadic human cases are not unexpected.

With continued incidence of avian influenza due to existing and new influenza A(H5) viruses in poultry, there is a need to remain vigilant in the animal and public health sectors. Community awareness of the potential dangers for human health is essential to prevent infection in humans. Surveillance should be continued to detect human cases and early changes in transmissibility and infectivity of the viruses.

For more information on confirmed cases of human infection with avian influenza A(H5) virus reported to WHO, visit: [http://www.who.int/influenza/human_animal_interface/en/](http://www.who.int/influenza/human_animal_interface/en/)

For information on monthly risk assessments on Avian Influenza, visit: [http://www.who.int/influenza/human_animal_interface/HAI_Risk_Assessment/en/](http://www.who.int/influenza/human_animal_interface/HAI_Risk_Assessment/en/)
Human infection with avian influenza A(H7N4) virus in China

Between 2 and 8 March 2018, no new cases of human infection with avian influenza A(H7N4) virus were reported to WHO in the Western Pacific Region. To date, a total of one laboratory-confirmed case of human infection with influenza A(H7N4) virus has been reported to WHO. This case was reported from China on 14 February 2018.

Human infection with avian influenza A(H7N9) virus in China

Between 2 and 8 March 2018, no new cases of human infection with avian influenza A(H7N9) virus was reported to WHO in the Western Pacific Region. As of 1 March, a total of 1,567 laboratory-confirmed human infections with avian influenza A(H7N9) virus, including 40 two to three person clusters, have been reported to WHO since early 2013.

Between 2 and 8 March 2018, China CDC has reported no new human cases with highly pathogenic avian influenza (HPAI) A(H7N9) virus, which have mutations in the hemagglutinin gene indicating a change to high pathogenicity in poultry. A total of 32 human cases of HPAI A(H7N9) virus were reported during the 5th wave. These 32 cases were from Fujian, Guangdong, Guangxi, Hebei, Henan, Hunan, Shaanxi, Taiwan (the case had travel history to Guangdong), and Yunnan. No increased transmissibility or virulence of the virus within human cases has been detected related to the HPAI A(H7N9) virus.

WHO is continuing to assess the epidemiological situation and will conduct further risk assessments as new information becomes available. The number and geographical distribution of human infections with avian influenza A(H7N9) viruses in the fifth epidemic wave (since October 2016) is greater than previous waves.

Further sporadic human cases of avian influenza A(H7N9) virus infection are expected in affected and possibly neighbouring areas. Should human cases from affected areas travel internationally, their infection may be detected in another country during or after arrival. However, if this were to occur, community level spread is considered unlikely as the virus does not have the ability to transmit easily among humans.

To date, there has been no evidence of sustained human-to-human transmission of avian influenza A(H7N9) virus. Human infections with the A(H7N9) virus are unusual and need to be monitored closely in order to identify changes in the virus and transmission behaviour to humans as this may have serious public health impacts.

Human infection with avian influenza A(H9N2) in China

Between 2 and 8 March 2018, 3 new cases of human infection with avian influenza A(H9N2) virus were reported to WHO in the Western Pacific Region. The onset dates of the last reported cases were 29 December 2017, 21 January 2018, and 13 February 2018. There have been two human cases of avian influenza A(H9N2) reported from China to WHO in 2018, and a total of 17 cases of human infection with avian influenza A(H9N2) in China have been reported since December 2015.
Animal infection with avian influenza virus

Between 2 March and 8 March 2018, outbreaks of avian influenza were reported in Vietnam and Taiwan, China.

Highly pathogenic avian influenza A(H5N1) virus infection in poultry in Cambodia

Highly pathogenic avian influenza A(H5N2) virus infection in poultry in Taiwan, China

- On 5 March 2018, an outbreak of avian influenza A(H5N2) among turkey at a farm in Yunlin country, Taiwan, China was notified to OIE. Among 1,900 susceptible birds, 348 died and the rest have been culled. [http://www.oie.int/wahis_2/public/wahid.php/Reviewreport/Review?reportid=26082](http://www.oie.int/wahis_2/public/wahid.php/Reviewreport/Review?reportid=26082)

Highly pathogenic avian influenza A(H5N6) virus infection in poultry in China

Highly pathogenic avian influenza A(H7N9) virus infection in poultry in China

- On 5 March 2018, an outbreak of avian influenza A(H7N9) among backyard poultry at a farm in Shaanxi province, China was notified to OIE. Among 1000 susceptible birds, 810 died and the rest have been culled. [http://www.oie.int/wahis_2/public/wahid.php/Reviewreport/Review?page_refer=MapFullEventReport&reportid=26078](http://www.oie.int/wahis_2/public/wahid.php/Reviewreport/Review?page_refer=MapFullEventReport&reportid=26078)
