Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by the Western Pacific Region countries and areas between week 1 and week 51 are presented in the table below. Influenza B is currently the predominant circulating subtype (Figure 1).

Table 1: Countries and areas reporting data to FluNet, Western Pacific Region, weeks 1 to 51, 2017

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel indicator based surveillance (IBS) systems as well as event-based surveillance. Case definitions, populations under surveillance and data formats differ among countries. This influenza surveillance summary includes countries/areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for ILI is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within the last 10 days and requires hospitalization.

Countries in the temperate zone of the Northern Hemisphere

In most countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity are consistent with seasonal trends.

Outpatient ILI Surveillance

China (North)
During week 51, the percentage of visits for ILI at national sentinel hospitals in northern China was 5.2%, which is higher than the previous week (4.9%) as well as the same week of 2014, 2015 and 2016 (3.9%, 2.7% and 3.5%) (Figure 2).

Mongolia (no update)
ILI activity remained at expected levels during week 49 compared to the previous week and seasons. The most recent peak in ILI activity occurred in week 4 of 2017 (Figure 3). Mongolia publishes weekly reports, available here: [http://www.flu.mn/eng/index.php?option=com_content&task=section&id=5&Itemid=51](http://www.flu.mn/eng/index.php?option=com_content&task=section&id=5&Itemid=51)

(Source: China National Influenza Center)

![Figure 3: Proportion of outpatient ILI visits (per 10,000 people), 2014-2017](image)
(Source: Mongolia National Influenza Center)
Republic of Korea
In week 51, there were 53.6 ILI cases per 1,000 outpatient visits, which was higher than the previous week (30.7). ILI activity is increasing in line with the 2016 seasonal increase (Figure 4). Korea publishes a weekly report, available here: http://www.cdc.go.kr/CDC/info/CdcKrInfo0301.jsp?menuIds=HOME001-MNU1154-MNU0005-MNU0037-MNU1380

Figure 4: Weekly ILI incidence rate per 1,000 patients, 2013-2017 (Source: Korean Centre for Disease Control and Prevention)

Sentinel influenza surveillance
Japan
In week 50, influenza activity in Japan shows a similar seasonal pattern to previous years with few influenza cases reported weekly per reporting sentinel hospital (Figure 5). More information about historical trends are available here: https://www.niid.go.jp/niid/en/10/2096-weeklygraph/1644-01flu.html

Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2007-2017 (Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone

Countries/areas in the tropical zone are observing influenza activity that is consistent with previous seasons.

**Surveillance**

**Hong Kong SAR (China) – ILI and hospital Surveillance**

In week 51, the average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics (GOPCs) was 3.9 ILI cases per 1,000 consultations, which was higher than that recorded in the previous week (3.5) (Figure 6). The average consultation rate for ILI among sentinel private doctors was 38.5 ILI cases per 1,000 consultations, which was lower than the rate recorded in the previous week (42.4) (Figure 7). Hong Kong SAR, China publishes a weekly report, available here: [http://www.chp.gov.hk/en/guideline1_year/29/134/441/304.html](http://www.chp.gov.hk/en/guideline1_year/29/134/441/304.html)

**China (South) - ILI Surveillance**

During week 51, the percentage of outpatient or emergency visits for ILI at national sentinel hospitals in southern China was 4.3%, which is higher than the last week (3.7%) as well as the same week of 2014, 2015 and 2016 (2.4%, 2.8% and 3.3%) (Figure 6).

**Singapore – Acute Respiratory Infection Surveillance**

The average daily number of patients seeking treatment in polyclinics for acute respiratory infection decreased from 2,677 per working day in week 50, to 2,729 per working day in week 51 (Figure 9). The proportion of patients with ILI among polyclinic attendances for ARI remained at 1.9%. Singapore publishes a weekly report, available here: [http://www.moh.gov.sg/content/moh_web/home/statistics/infectiousDiseasesStatistics/weekly_infectiousdiseasesbulletin.html](http://www.moh.gov.sg/content/moh_web/home/statistics/infectiousDiseasesStatistics/weekly_infectiousdiseasesbulletin.html)
Lao PDR
In week 50, influenza activity decreased compared to the previous week. In week 50 the number of cases is higher than that reported in the same week between 2012 and 2015 but lower than that reported in 2016 (see Figure 10).

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity followed seasonal trends.

Australia – Laboratory-confirmed influenza (no update)
The number of laboratory confirmed influenza cases has decreased from a peak reached in week 33. As of 27 October 2017 (week 42), a total of 229,579 notifications of laboratory confirmed influenza were reported to the National Notifiable Diseases Surveillance System (Figure 11). Sixty-three percent of notifications were influenza A (57% A(unsubtyped), 4% influenza A(H3N2) and 1% influenza A(H1N1pdm09)), 37% were influenza B and less than 1% were influenza A&B co-infections or untyped. Australia publishes influenza surveillance reports on a fortnightly basis during the influenza season, typically between May and October. For more information: http://www.health.gov.au/internet/main/publishing.nsf/content/cda-surveil-ozflu-flucurr.htm#current

New Zealand – Influenza like Illness (no update)
During week 39, 80 patients with influenza-like illness consulted sentinel general practices in 20 district health boards (DHBs). The weekly ILI incidence was 19.5 per 100 000 patient population. Of the 36 laboratory tested ILI cases, eight were positive for influenza viruses. This gives an ILI related influenza incidence (adjusted) of 4.3 per 100 000 patient population. New Zealand publishes a weekly report, available here: https://surv.esr.cri.nz/virology/influenza_weekly_update.php

(Source: National Notifiable Diseases Surveillance System, Australian Department of Health)
Pacific Island Countries and Areas (PICs) - ILI Surveillance
In the Pacific Island Countries and Areas, in week 50, the number of ILI cases reported compared to previous weeks increased in several PICs, including Tonga and Vanuatu (Figure 13). The PICs submit a report on a weekly basis, for more information:
