Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by the Western Pacific Region countries and areas between weeks 1 and 15 are presented in the table below. In this period, both influenza A and B are circulating, with A(H1N1)pdm09 –predominating in recent weeks (Figure 1).

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included, and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that require hospitalization.

Countries in the temperate zone of the Northern Hemisphere

In most countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity is lower than the corresponding period from previous years.

Outpatient ILI Surveillance

China (North)

During week 15, the percentage of visits for ILI at national sentinel hospitals in northern China was 2.3%, which is lower than the previous week (2.5%), and lower than the same week of 2015 to 2017 (2.5% and 2.6% and 2.5%) (Figure 2).

Mongolia

ILI activity in Mongolia decreased from the previous week, and has decreased since week 51 of 2017 (Figure 3). Mongolia publishes weekly reports, available here: http://www.flu.mn/eng/index.php?option=com_content&task=section&id=5&Itemid=51

(Source: China National Influenza Center)

Figure 3: Proportion of outpatient ILI visits (per 10,000 people), 2016-2018
(Source: Mongolia National Influenza Center)
Republic of Korea

In week 15, there were 6.8 ILI cases per 1,000 outpatient visits, which was higher than the previous week (6.2) (Figure 4). Korea publishes a weekly report, available here: http://www.cdc.go.kr/CDC/info/CdcKrInfo0301.jsp?menuIds=HOME001-MNU1154-MNU0005-MNU0037-MNU1380

Sentinel influenza surveillance

Japan

In week 13, influenza activity in Japan decreased compared to same period in 2016 and 2017 (Figure 5). More information about historical trends are available here: https://www.niid.go.jp/niid/en/10/2096-weeklygraph/1644-01flu.html

(Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone

Countries and areas in the tropical zone are observing influenza activity that is consistent with previous seasons.

**Surveillance**

**Hong Kong SAR (China) – ILI and hospital Surveillance**

In week 15, the average consultation rate for ILI among outpatient clinics was 3.6 ILI cases per 1,000, which was higher than that recorded in the previous week (3.4 per 1,000) (Figure 6). The average consultation rate for ILI among private doctors was 25.1 ILI cases per 1,000 consultations, which was higher than the rate recorded in the previous week (21.8 per 1,000) (Figure 7). Hong Kong SAR, China publishes a weekly report, available here: http://www.chp.gov.hk/en/guideline1_year/29/134/441/304.html

**China (South) - ILI Surveillance**

During week 15, the percentage of outpatient or emergency visits for ILI at national sentinel hospitals in southern China was 3.5%. This is lower than the previous week (3.7%) and the same week of 2016 (3.7%), and higher than the same week of 2015 and 2017 (2.8% and 3.2%) (Figure 8).

**Singapore – Acute Respiratory Infection (ARI) Surveillance**

The average daily number of patients seeking treatment in polyclinics for acute respiratory infection decreased from 2,969 (over 5.5 working days) in week 14 to 2,959 (over 5.5 working days) in week 15 (Figure 9). The proportion of patients with ILI among polyclinic attendances for ARI was 2.0%. Singapore publishes a weekly report, available here: http://www.moh.gov.sg/content/moh_web/home/statistics/infectiousDiseasesStatistics/weekly_infectiousdiseasesbulletin.html
Lao PDR

In week 15, ILI activity decreased compared to the previous week. It is lower than that reported in the corresponding weeks in 2015 to 2017. (see Figure 10).

Influenza Situation Update

In the temperate zone of the southern hemisphere, influenza activity followed seasonal trends.

**Australia – Laboratory-confirmed influenza (no update)**
The number of laboratory confirmed influenza cases has decreased from a peak reached in week 33. From 1 January 2017 to 27 October 2017, a total of 229,579 laboratory-confirmed cases of influenza were reported to the National Notifiable Diseases Surveillance System (Figure 11). Sixty-three percent of notifications were influenza A (57% A(unsubtyped), 4% influenza A(H3N2) and 1% influenza A(H1N1pdm09)), 37% were influenza B and less than 1% were influenza A&B co-infections or untyped. Australia publishes influenza surveillance reports on a fortnightly basis during the influenza season, typically between May and October. For more information: http://www.health.gov.au/internet/main/publishing.nsf/content/cda-surveil-ozflu-flucurr.htm#current

*Figure 11: Australian notifications of laboratory confirmed influenza (Source: National Notifiable Diseases Surveillance System, Australian Department of Health)*

**New Zealand – Influenza like Illness (no update)**
During week 39, 80 patients with influenza-like illness consulted sentinel general practices in 20 district health boards (DHBs). The weekly ILI incidence was 19.5 per 100,000. Of the 36 laboratory tested ILI cases, eight were positive for influenza viruses. This gives an ILI related influenza incidence of 4.3 per 100,000 patient population. New Zealand publishes a weekly report, available here:

*Figure 12: Weekly ILI and influenza incidence from Week 1 of 2017 in New Zealand (Source: Institute of Environmental Science and Research Ltd (ESR), New Zealand)*
In the Pacific Island Countries and Areas, in week 15, the number of ILI cases reported in Fiji, New Caledonia, Niue and Solomon Islands increased compared to previous weeks (Figure 13). The PICs submit a report on a weekly basis, found here: http://www.wpro.who.int/southpacific/programmes/communicable_diseases/disease_surveillance_response/page/en/index2.html
